There is no "study" needed to determine if magnesium chloride is corroding our vehicles. Just stop using the damn stuff. The vast majority of CT citizens would prefer the old sand and salt mixture used years ago. So what if road crews have to sweep it up in the spring? It is safer for all concerned, including the environment. I will never buy a new car again as long as I live and drive in CT in the winter, and watch the vehicle not only deteriorate within a couple years, but also depreciate rapidly because of poor overall condition.

My vote = stop using magnesium chloride immediately and go back to salt/sand mixture.

Thank you.

George Lee, Ashford, CT
